

GO-LIVE & DEMO PLAYBOOK

Set up the system & run the demo

A complete, click-by-click guide: publish the CRM to your live domain, connect WhatsApp and email, and present the full lead-to-customer journey with confidence.

Deploy

Connect

Demo

How to use this guide: do the parts in order. Do not skip. Replace anything in < angle brackets > with your real value.

Before you begin – the 4 golden rules

Read these once. They prevent 90% of go-live problems.

#	RULE	WHY IT MATTERS
1	Run <code>php artisan key:generate</code> only once . Never change <code>APP_KEY</code> after that.	If it changes, all saved integration passwords become unreadable and WhatsApp/email stop working.
2	The website must serve the public folder, not the project root.	Otherwise you get a blank page or a directory listing.
3	The Meta "Verify Token" must be identical to the one you type in the CRM.	The webhook won't connect if they differ by even one character.
4	Write down every value you create as you go.	You'll reuse DB credentials, Meta IDs/tokens and the Gmail app password across steps.

About the screenshots: pictures in this guide show the **Agrocorp CRM** screens you'll use. Steps that happen on another company's website (Hostinger, Meta/Facebook, Google) are written out click-by-click because those screens live on their sites, not inside the CRM.

What you need ready

- 1 A **Hostinger** plan with **SSH access** (VPS is best; Cloud/Business also work).
- 2 Your **domain** connected to Hostinger.
- 3 A terminal on your computer (Windows: **PowerShell**; Mac: **Terminal**).
- 4 A **Facebook** login and a **Meta Business** account (you can create the Business account during Part E).
- 5 A **Gmail / Google Workspace** mailbox you control (e.g. `crm@yourdomain.com`).
- 6 **Your own phone (with WhatsApp) and email** – you'll use these as the "demo customer" so real messages arrive on screen.
- 7 About **2–3 hours**. Start early – Meta can take a while to approve message templates.

PART A — Put the code on Hostinger

Get the application files onto your server and point the website at them.

A1. Turn on SSH and connect On Hostinger

- 1 Log into Hostinger and open **hPanel**.
- 2 Left menu → **Advanced** → **SSH Access**. If disabled, click **Enable**.
- 3 Write down the **SSH IP/Host**, **Port** (often 65002) and **Username**.
- 4 On your computer's terminal type, then press Enter:

```
ssh -p <Port> <Username>@<Host>
```
- 5 First time it asks to continue → type **yes** → Enter. Then type your Hostinger password (the characters stay hidden — that's normal).
- 6 Go to your domain folder: `cd ~/domains/<yourdomain.com>` (run `ls ~/domains` if unsure of the exact name).

A2. Copy the project into a folder named app

Easiest (GitHub):

- 1 In the Emergent chat, click **Save to GitHub** and copy the repository URL.
- 2 On the server run: `git clone <your-repo-url> app`
- 3 Wait for "done." — you now have `~/domains/<yourdomain.com>/app`.

Alternative (ZIP upload): hPanel → **File Manager** → open your domain folder → create a folder **app** → **Upload** the ZIP → right-click → **Extract**. Confirm `artisan`, `composer.json`, `public` and `routes` sit directly inside `app`.

A3. Make the website show the public folder On Hostinger

- 1 hPanel → **Websites** → click your domain → **Dashboard**.
- 2 Find **Website root / Document root** (may be under **Advanced / Website settings**).
- 3 Set it to: `domains/<yourdomain.com>/app/public` and **Save**.

If your plan has no document-root setting (some serve only from `public_html`): ask Hostinger support to set the web root, or move the project outside `public_html` and copy the contents of `app/public` into `public_html`, editing the two require paths in `public_html/index.php` to point to `../app/vendor/autoload.php` and `../app/bootstrap/app.php`.

PART B — Install & configure the app

Run every command from inside the project folder: `cd ~/domains/<yourdomain.com>/app`

B1. Install and prepare

- 1 Install libraries: `composer install --no-dev --optimize-autoloader`
- 2 Create the settings file: `cp .env.example .env`
- 3 Generate the key **once**: `php artisan key:generate` (you'll see "Application key set successfully").

B2. Create the database On Hostinger

- 1 hPanel → **Databases** → **MySQL**.
- 2 Create a database (e.g. `agrocorp_crm`), a user (e.g. `agrocorp_user`) and a strong password.
- 3 Write down the **full names** it shows (Hostinger adds a prefix like `u123_agrocorp_crm`).

B3. Fill in the `.env` file

Edit `.env` (nano `.env` on the server, or File Manager → Edit). Set at least:

```
APP_NAME="Agrocorp CRM"
APP_ENV=production
APP_DEBUG=false
APP_URL=https://<yourdomain.com>
APP_TIMEZONE=Asia/Kolkata
DB_CONNECTION=mysql
DB_HOST=localhost
DB_PORT=3306
DB_DATABASE=<full db name>
DB_USERNAME=<full db user>
DB_PASSWORD=<db password>
SESSION_DRIVER=database
SESSION_SECURE_COOKIE=true
MAIL_MAILER=log
```

Leave the `APP_KEY` line exactly as `key:generate` created it. Keep `MAIL_MAILER=log` for now — you'll switch email on from inside the CRM in Part F.

B4. Build the database & finish setup

- 1 Create tables: `php artisan migrate --force`
- 2 Load starter data + demo users: `php artisan db:seed --force`
- 3 Make uploads public: `php artisan storage:link`
- 4 Fix permissions: `chmod -R 775 storage bootstrap/cache`
- 5 Speed it up: `php artisan config:cache` then `php artisan route:cache`

After any future change to `.env`, run `php artisan config:clear` then `php artisan config:cache`.

PART C – Turn on HTTPS and the scheduler

C1. HTTPS (SSL) On Hostinger

- 1 hPanel → **Security** → **SSL** → select your domain → **Install SSL** (free) → wait until "Active".
- 2 Turn on **Force HTTPS** so `http://` automatically redirects to `https://`.

C2. Cron / scheduler – REQUIRED for reminders & campaigns On Hostinger

- 1 hPanel → **Advanced** → **Cron Jobs** → **Create**.
- 2 Frequency: **Every Minute** (or set all five boxes to *).
- 3 Command (replace the path; run `which php` to find your PHP path):
`cd /home/<user>/domains/<yourdomain.com>/app && php artisan schedule:run >> /dev/null 2>&1`
- 4 Save.

Why this matters: without cron, payment reminders, visit reminders and scheduled WhatsApp/email campaigns will never fire.

PART D — First login & a quick health check

The Agrocorp CRM sign-in screen. If you see this at <https://<yourdomain.com>>, your deployment is working.

- 1 Open <https://<yourdomain.com>> in Chrome or Edge.
- 2 Sign in with the seeded admin account (email and password are in your credentials file).
- 3 **Immediately change the password:** top-right avatar → **Account Settings** → **Security**.

Blank page or error? On the server run `php artisan config:clear`, then read the last lines of `storage/logs/laravel.log`. Usual causes: website root not pointed at `/public` (A3), wrong DB details (B3), or unwritable storage (rerun the `chmod` in B4).

PART E – Connect real WhatsApp (fast demo path)

You do **not** need Business Verification for the demo. Meta gives you a free **test number** that can message up to 5 phone numbers you verify. Use that.

E1. Create the Meta app On developers.facebook.com

- 1 Go to **developers.facebook.com** and log in with Facebook.
- 2 Top-right → **My Apps** → **Create App**.
- 3 "What do you want your app to do?" → choose **Other** → Next.
- 4 App type → **Business** → Next.
- 5 Name it **Agrocorp CRM** → pick your Business account if asked → **Create app**.

E2. Add WhatsApp & copy the credentials

- 1 In the app, find the **WhatsApp** product → click **Set up**.
- 2 You land on **WhatsApp** → **API Setup**. Copy and write down: the **Temporary access token**, the **Phone number ID**, and the **WhatsApp Business Account ID (WABA ID)**.
- 3 Left menu → **App settings** → **Basic** → reveal and copy the **App Secret**.
- 4 Invent a **Verify Token** word, e.g. `agrocorp_verify_2026`. Write it down.

E3. Add YOUR phone as a recipient

- 1 On the API Setup screen, open the "To" dropdown → **Manage phone number list**.
- 2 Enter your WhatsApp number in full international format (e.g. `+91XXXXXXXXXX`).
- 3 Enter the confirmation code Meta sends you on WhatsApp. Repeat for teammates (max 5).

E4. Enter the credentials in the CRM

CRM → Integrations. Open the **Meta WhatsApp Cloud** card, fill the fields, Save, then use **Run connection check**.

- 1 CRM → **Integrations** → open **Meta WhatsApp Cloud**.
- 2 Fill: **Access Token**, **Phone Number ID**, **WABA ID**, **App Secret**, and **Verify Token** (= agrocorp_verify_2026).
- 3 Click **Save**, then **Run connection check** – you want "WhatsApp number verified" to be **green**.
- 4 Toggle the integration **ON / Enable**. Templates auto-sync.

E5. Set the webhook On developers.facebook.com

- 1 Meta app → **WhatsApp** → **Configuration** → **Webhook** → **Edit**.
- 2 Callback URL: `https://<yourdomain.com>/api/v1/webhooks/whatsapp`
- 3 Verify token: agrocorp_verify_2026 (exactly as in the CRM) → **Verify and save**.
- 4 Under **Webhook fields** → **Manage** → **Subscribe** to messages.

E6. Create & approve templates

CRM → WhatsApp Templates. Build a template, click Submit, and wait for status **APPROVED**. The pre-made **hello_world** template is always available.

- 1 CRM → **WhatsApp Templates** → **New template** → fill name (lowercase_with_underscores), body and buttons → **Save draft** → **Submit**.
- 2 Wait for the status to change to **APPROVED** (click **Sync from Meta** to refresh). Submit any templates you'll demo **today**.
- 3 Tip: quick-reply buttons can **launch a chatbot** — pick a bot in the button's "Launch bot" dropdown.

PART F – Connect real email (Gmail)

F1. Prepare the mailbox On myaccount.google.com

- 1 Go to myaccount.google.com → **Security**.
- 2 Turn on **2-Step Verification**.
- 3 Open **App passwords** → App: **Mail** → Device: "Other" → type "Agrocorp CRM" → **Generate**. Copy the 16-character password.

F2. Enter it in the CRM

- 1 CRM → **Integrations** → **Google / SMTP Email**.
- 2 Host `smtp.gmail.com`, Port 587, Mailbox (your address), App Password (the 16 characters), From Name/Email.
- 3 Click **Save** → **Test** (want "SMTP authenticated") → **Enable**.
- 4 Real test: use "Forgot password" or add a lead with your email and check your inbox (and spam).

PART G – Create your demo people

The screenshot displays the 'Users & Roles' management page in the Agrocorp CRM. The interface includes a sidebar with navigation options like Overview, Dashboard, Tasks, Reports & Analytics, Leads, Pipeline, Call List, Site Visits, Inventory, Import, Bookings, Collections, Demand Letters, and Discount Approvals. The main content area shows a summary of users and roles, categorized into Administration (2 users) and Sales (4 users). The Administration section includes 'Process Admin' and 'Super Admin'. The Sales section includes 'Aisha Khan', 'Karan Malhotra', 'Priya Sharma', and 'Rahul Verma'. Each user card displays their name, email, role, and an 'Active' toggle switch. The top right of the page features a search bar, a notification bell, and a '+ Add User' button.

Category	User	Role	Active	
ADMINISTRATION (2)	PA	Process Admin	process@crm.local	Active
	SA	Super Admin	admin@crm.local	Active
SALES (4)	AK	Aisha Khan	aisha@crm.local	Active
	KM	Karan Malhotra	bdm@crm.local	Active
	PS	Priya Sharma	priya@crm.local	Active
	RV	Rahul Verma	rahul@crm.local	Active

CRM → Users & Roles. Add the people you'll act as during the demo.

- 1 CRM → **Users & Roles** → add a **BDE** and a **Sales Head** with real emails you can open.
 - 2 Set memorable demo passwords and write them down.
 - 3 Create the **demo customer lead using your own phone + email** so every WhatsApp/email lands on your devices on screen.
-

PART H – The night before

- 1 **WhatsApp office hours:** CRM → **Inbound Rules** → set business hours to cover the demo time, or turn office hours off. (Outside hours, bots reply with an "away" message.)
- 2 **Pre-warm the AI dashboard:** log in as a Sales user and open the Dashboard once (the first load is slow ~10–30s, then instant).
- 3 **Templates:** confirm the ones you'll show say **APPROVED**.
- 4 **Full dry-run:** do the whole demo once, end to end, with your phone + email as the customer.
- 5 **Backup:** screen-record the dry-run in case the internet misbehaves.

PART I – Run the demo (matches your 12 points)

A smooth order that tells a story from first contact to a paying customer.

The dashboard – a live overview of the whole business (pipeline, hot/warm/cold, sources, integration health).

3-4. Project & inventory mapping

Inventory – projects, phases and colour-coded plot availability (Available / Held / Booked / Sold).

5-6. Integrations & templates

Open **Integrations** and show WhatsApp + Email connected (green), then show an **APPROVED** WhatsApp template. Optionally show the **WhatsApp Bots** builder.

*WhatsApp Bots – a visual builder with message, buttons, list, capture, **Book a visit** and agent-handoff steps.*

7-8. Lead capture & round-robin

Capture a lead from a source (website form / chatbot, or message your WhatsApp test number from your phone), and add one manually to show **round-robin** auto-assignment to a BDE.

Leads list – every captured lead with owner, temperature and stage.

9-10. BDE works the lead + live comms

Log in as the BDE, open the **Lead Cockpit**, qualify the lead and **schedule a site visit** — your phone receives the real WhatsApp confirmation. Show the activity timeline filling with sent messages and automations.

The screenshot displays the 'Lead Cockpit' interface for a lead named Vikram Nair. The interface is divided into several sections:

- Header:** Includes the Agrocorp CRM logo, a search bar, and a notification bell.
- Lead Card:** Displays the lead's name (Vikram Nair), initials (VN), email (vikram@example.com), phone (9812345670), and a 'Hot' status indicator with a score of 82. It also shows the lead's status as 'Opportunity' and a 'Schedule Visit' button.
- DETAILS:** A table of lead information:

ALT PHONE	CITY
—	Bengaluru
SOURCE	CAMPAIGN
Website Form	—
PROJECT	OWNER
Skyline	Rahul Verma
Residences	—
VERIFIED	ATTEMPTS
Yes	0
- JOURNEY:** A section indicating 'No active lead-flow yet' and a note that the lead's live position will appear once a workflow is activated.
- QUALIFICATION:** A table of qualification details:

INTEREST	TIMELINE
very_high	immediate
BUDGET	
₹60,00,000-₹90,00,000	
FINANCING	DECISION
loan	self
PREFERRED LOCATION	
Whitefield	
- LOG AN ACTIVITY:** A section for logging activities with buttons for 'Note', 'Communicate', and 'Add note'.
- ACTIVITY TIMELINE:** A section showing 'No activity yet'.
- OPEN TASKS:** A section showing 'No open tasks'.
- QUOTE / COST SHEET:** A section with a button to 'Open' the quote or cost sheet.
- BOOKING:** A section with a button to 'Open' the booking and payment plan.
- POST-SALES:** A section with a button to 'Open' the handover, agreements, and demands.

The full-width Lead Cockpit — details, qualification, journey, an activity composer (Note / WhatsApp / Email / Call) and the live timeline.

11. Pre-sales → sales → post-sales

Move the lead through the stages on the pipeline. Some stages ask for a couple of fields (budget, timeline) – pre-fill them so nothing blocks you on stage.

The screenshot shows the Agrocorp CRM interface. On the left is a sidebar with a navigation menu. The main area displays a 'Pipeline' view with four stages: NEW LEAD, CONTACTED, INTERESTED, and OPPORTUNITY. Each stage contains one or more lead cards. The NEW LEAD stage has a card for Divya Iyer (Cold, 20). The CONTACTED stage has a card for Arjun Mehta (Warm, 48). The INTERESTED stage has a card for Sneha Reddy (Warm, 55). The OPPORTUNITY stage has a card for Vikram Nair (Hot).

CONTACTED (1)

- Arjun Mehta (arjun@example.com) - Warm (48)

INTERESTED (1)

- Sneha Reddy (sneha@example.com) - Warm (55)

OPPORTUNITY

- Vikram Nair (vikram@example.com) - Hot

The pipeline — drag a lead between stages; transitions follow the business rules.

12. Booking, cost sheet & payments

- 1 Mark the deal **Won** → a booking is created and the unit is held/booked.
- 2 Generate the **cost sheet**, pick a **payment plan**, and record a **payment** — a serial receipt is produced.
- 3 To show a payment/visit **reminder instantly** (instead of waiting), an admin can SSH in and run:
`php artisan crm:reminders` (and `php artisan crm:email-scheduled`, `php artisan wa:campaigns:dispatch`).

PART J – If something goes wrong (quick fixes)

SYMPTOM	FIX
Blank page / HTTP 500	<code>php artisan config:clear</code> then read <code>storage/logs/laravel.log</code> . Usual causes: web root not on <code>/public</code> , wrong DB details, unwritable storage.
"419 page expired" at login	<code>APP_URL</code> must be your exact https domain; keep <code>SESSION_SECURE_COOKIE=true</code> ; then <code>php artisan config:clear</code> .
WhatsApp won't send	Integrations → Run connection check . Red number = token expired (regenerate on Meta API Setup) or recipient not in your verified list (E3).
Webhook won't verify	The Verify Token in Meta must exactly match the CRM field; the site must be reachable on https.
Reminders/campaigns don't fire	The cron (C2) is missing or the PHP path is wrong. Run <code>which php</code> and use that full path; test with <code>php artisan crm:reminders</code> .
Emails not arriving	Re-Test SMTP; ensure 2-Step is on and you used the 16-character app password (not your login); check spam.
Template stuck PENDING	Meta is reviewing it; use <code>hello_world</code> meanwhile and click Sync from Meta to refresh.
Razorpay / e-sign	These stay simulated unless you add those provider keys – narrate them as "mock" for the demo.

Where to get help fast: Hosting steps → Hostinger 24/7 chat (hPanel → Help). WhatsApp/Meta → developers.facebook.com/docs/whatsapp/cloud-api. CRM side → the Integrations "Run connection check" tells you exactly what's missing.

You're ready. Deploy (A-C) → verify (D) → connect WhatsApp & email (E-F) → prep people (G-H) → present (I). Keep this guide open on a second screen during the demo.
